

Hi there! Let's learn about snakes and that special thing they do with their tongues.

1. **\*\*Snakes Have Tongues\*\***: Just like you use your tongue to taste or feel things, snakes have long, thin tongues too!
2. **\*\*Why Do They Stick It Out?\*\***: When a snake sticks out its tongue, it's actually trying to learn more about what's around it. Snakes don't have ears like we do, and they can't smell like we do either. So, they use their tongues to **sniff** things out!
3. **\*\*How Does It Work?\*\***: When a snake sticks its tongue out, it collects tiny particles of smell from the air. Then, it pulls its tongue back in and puts it into a special part of its mouth where it can 'taste' those smells. This helps the snake to understand what's around it, like finding food or knowing if there are other animals nearby.
4. **\*\*What Happens Next?\*\***: After tasting the smells, the snake decides what to do next! It might crawl closer to a yummy mouse or just keep exploring its area.

So, the next time you see a snake sticking its tongue out, remember, it's sniffing around to learn about its world!
