

## **What is a Yak?**

A yak is a large, furry animal that lives in the mountains of Tibet and other cold places. They look a bit like cows but have long hair that helps them stay warm.

## **Why is Yak Fur Special?**

The fur of a yak is very thick. This thick fur is like a warm blanket, protecting the yak from the cold weather. It also keeps the yak dry because it is waterproof! This means that when it rains or snows, the water doesn't soak through to the yak's skin.

## **How Does the Yak Stay Warm?**

The thick, waterproof fur traps warmth from the yak's body. This means that even when it is really chilly outside, the yak can stay warm while it grazes on grass and plants. The yaks also grow even thicker fur in the winter to keep them cozy.

## **How Do Yaks Help People?**

People living in cold mountains use yaks for many reasons. People can use their fur to make warm clothing, and they can also use their milk to make cheese. Yaks are very helpful animals!

## **Conclusion**

Yaks are amazing creatures with thick, warm, and waterproof fur that keep them cozy in the cold mountains. They are not only important to nature, but they also help many people who care for them!
