

How Yaks Stay Warm and Dry

Yaks are amazing animals that live in very cold places, like the mountains of Tibet. They have thick fur that is really special!

- 1. Thick Fur:** Yaks have a lot of fur that covers their bodies. This fur is very thick, which means it traps warm air and keeps their bodies cozy when it's cold outside.
- 2. Waterproof Fur:** Not only is the fur thick, but it is also waterproof. This means that if it rains or snows, the water does not soak through to their skin. Instead, the water runs off, keeping the yak dry.
- 3. Staying Cozy:** Because of their special fur, yaks can live happily in snowy places where it gets really cold. They can stay warm and dry, which helps them stay healthy and strong!

So, yaks are like nature's own winter coats, helping them stay warm and dry in the coldest weather!
