

To determine who wrote a particular article, you can follow these step-by-step guidelines:

1. **Check the Article Header:** Most articles will have the author's name at the top or bottom of the piece. Look for labels like 'by,' followed by the author's name.
2. **Look for an Author Bio:** Many articles include a short biography of the author either at the end of the article or on a separate author page. This bio might include the author's credentials, other works, and areas of expertise.
3. **Search the Publication:** If the article is featured in a magazine, journal, or website, visit the publication's homepage. They often list authors, especially if they feature regular contributors.
4. **Use Search Engines:** If you can't find the author's name directly in the article, try searching for the article title in a search engine. Sometimes, additional information about the article, including its author, will be available in the search results.
5. **Explore References and Citations:** If the article references research or other articles, the original authors may be mentioned. Looking at cited works can give you clues about the article's authorship.
6. **Check the Journal or Database:** For academic articles, databases often provide detailed metadata that includes the author's information. Use tools like Google Scholar, JSTOR, or specific publishers' websites for access.
7. **Consult Library Resources:** If you have access to a library, librarians can assist in finding authorship and verifying articles through various databases.

By following these steps, you should be able to identify who wrote the article in question effectively. Additionally, knowing the author's background can enhance your understanding of the article's context and reliability.
