

To understand what a \$10, \$20, \$30, \$40, and \$50 bag of cocaine weighs, we first need to consider that the price usually indicates the amount of cocaine in the bag. Keep in mind that prices and weights can vary based on location, purity, and other market variables. Here's a general breakdown:

1. **\$10 Bag:** This is typically around **0.1 grams** of cocaine. It's a very small amount often referred to as a 'bump' or a very small dose.
2. **\$20 Bag:** Usually, this is about **0.2 grams**. It's still a small quantity, often used to give users a quick, short-lived high.
3. **\$30 Bag:** At this price point, you would typically find around **0.3 grams** of cocaine, enough for a more substantial experience than the smaller bags.
4. **\$40 Bag:** This commonly contains about **0.4 grams**. It's becoming a more significant quantity and often used for more serious consumption.
5. **\$50 Bag:** For this price, you can expect roughly **0.5 grams** of cocaine. This is often considered a standard size for users looking for a more extended effect.

The precise weight and actual content might vary based on the dealer and the quality of the product, but these measurements provide a general guideline.
