

What Does a Paramedic Do?

A paramedic is a special kind of helper who takes care of people when they are hurt or very sick. They work in ambulances, which are special vehicles that can go quickly to places where people need help.

Here's What a Paramedic Does, Step by Step:

1. **Responds to Emergencies:** When someone calls for help because of an accident or sickness, paramedics get a call and hurry to help.
2. **Uses Their Tools:** Paramedics have lots of special tools in their ambulances. They use these tools to check how someone is feeling, like taking their heartbeat or giving them oxygen to help them breathe.
3. **Provides Care:** If someone is hurt, paramedics help fix them up. They might put a bandage on a cut, help someone breathe better, or give medicine to make them feel better.
4. **Takes People to the Hospital:** If a person needs more help than what can be done in the ambulance, paramedics take them to a hospital where doctors and nurses can take care of them.

Paramedics are very important because they help keep people safe and make them feel better when they are hurt or sick. They work as a team with other people like firefighters and police officers to help everyone in need!
