

Hi there! Let's talk about fog and clouds!

Fog is like a special kind of cloud that hugs the ground. You know how clouds float high up in the sky? Fog is like those clouds, but it's very low, almost touching the land!

When the air is cool and wet, tiny water droplets form and spread out, making it hard to see. That's why we call it fog. It looks like a thick mist all around us.

Now, low clouds are clouds that are also close to the earth, but they're not as thick as fog. They're still up in the sky but just lower than other clouds. They can look fluffy, like cotton candy, and sometimes they bring rain or snow.

So, to sum it up: fog is a special type of low cloud that we see when it's very damp outside, and it sits right on the ground. Low clouds are a little higher up and can be different kinds of fluffy clouds!

Isn't that cool?
