

An astronaut is a person who travels to space. Just like how pilots fly airplanes, astronauts are trained to go into outer space in spacecraft like rockets and shuttles. They wear special suits called spacesuits to keep them safe in the harsh conditions of space.

Before becoming an astronaut, people need to study a lot in school and university to learn about science, technology, engineering, and math. This helps them understand the complicated things about space and the spacecraft they use to go there.

Think of astronauts like explorers, just like the ones who traveled to discover new lands on Earth a long time ago. They go to space to learn new things about planets, stars, and the universe. When they go to space, astronauts do a lot of experiments and research to help us understand more about the place we live in, which is the universe.

One famous example of an astronaut is Neil Armstrong. He was the first person to walk on the moon in 1969 during the Apollo 11 mission. Imagine walking on the moon like how you go hiking or camping, but the moon is much farther away and very different from Earth!

Being an astronaut is a really cool and important job because they help us learn more about the amazing world beyond our planet Earth.
