

What Happens in Spring?

When spring comes, it's like nature is waking up from a long nap! Let's break down what happens:

1. The Snow Melts

In winter, there is often a lot of snow that covers the ground. When spring arrives, the weather starts to get warmer. The heat from the sun makes the snow melt, turning it back into water. This water goes into the ground and helps plants grow!

2. Streams Start to Trickling

As the snow melts, it creates small rivers called streams. These streams start to flow with fresh water. You can hear the nice sounds of water moving, like music from nature!

3. Birds Come Back

During the colder months, many birds fly to warmer places where it's easier to find food. When spring arrives, these birds come back to our area. You might see them making nests, singing, and flying around in the trees.

4. Flowers Begin to Bloom

With the warmer weather and water from the melted snow, flowers start to grow and bloom. You'll see beautiful colors pop up everywhere!

So, spring is a really exciting time when everything in nature comes back to life! It's filled with new beginnings and fresh starts!
