

# What is a Square Picture?

A square picture is a type of image that has equal sides. This means that the length of the top and bottom sides is the same as the length of the left and right sides. If you think of a box, a square picture looks just like that!

## Step 1: Identify the Shape

To understand a square picture, first, find its corners. A square has four corners. Each corner makes a 90-degree angle, which is like the corner of a piece of paper. Can you point to the corners of a square picture?

## Step 2: Measure the Sides

Next, let's look at how to measure the sides. Take a ruler and measure one side of the square picture. Then measure the other side - guess what? They should be the same length! That's what makes it a square.

## Step 3: Examples of Square Pictures

Can you think of examples of square pictures? Think about social media images, some video game icons, or even some of your favorite stickers - many of them are square! You can also draw a square picture yourself by making sure all sides are equal.

## Step 4: Fun Activity

Let's have some fun! Grab a piece of paper and a pencil. Try drawing a square and then adding something cool in it, like your favorite animal or a smiley face. Remember, the key is that all four sides of your drawing should be the same length!

## Conclusion

Now you know all about square pictures! They are simple shapes that have four equal sides and corners. Next time you see a square picture, you can share what you learned!
