

The area under bedrock is like a hidden treasure chest filled with mysterious secrets and surprises waiting to be discovered. Just like how you can find exciting things under your bed, scientists believe there is a whole new world beneath the solid rock that covers the Earth's surface. This place is too deep for us to reach with our hands or tools, so we have to use special technology like seismic waves to peek below the surface. Under bedrock, there are layers of solid rock and even hotter molten rock that flow like a lava lamp. It's like a giant puzzle waiting to be solved by curious explorers!
