

Instructions

Read the information below about sturgeons, then complete the activities that follow.

Sturgeon Information

Sturgeons are an ancient group of fish that belong to the family Acipenseridae. They are known for their distinctive appearance, featuring a long, streamlined body, a flattened snout, and rows of bony plates along their backs. Sturgeons are primarily found in the northern hemisphere, inhabiting freshwater rivers and lakes, as well as some coastal waters.

Sturgeons are famous for producing caviar, which is made from their eggs. However, many sturgeon species are considered endangered due to overfishing, habitat loss, and pollution. Conservation efforts are vital to ensure the survival of these remarkable creatures.

Questions

1. **What are some key physical features of sturgeons?**

2. **In which regions of the world can sturgeons primarily be found?**

3. **What is caviar, and why is it significant in relation to sturgeons?**

4. **List two major threats to sturgeon populations.**

Activity

Imagine you are a wildlife conservationist working to save sturgeons from extinction. Write a short paragraph (4-5 sentences) describing one initiative you would implement to protect sturgeon habitats.
