Here's a step-by-step explanation of how to create the worksheet based on the thought process: 1. **Understand Requirements**: We need a printable HTML worksheet about US states and capitals without a title or name/date fields. Instructions start with

, followed by a list where each state is paired with an input or textarea. 2. **Structure Instructions**: Use an

tag for the instructions, explaining to match states and capitals and write answers in spaces provided, using the correct answer format. 3. **Content Selection**: Choose 10 states with a regional mix, including both well-known and less-known capitals to test varied knowledge levels. 4. **Format Each Question**: Use an unordered list for the states. Alternate between input tags for single-line answers and textarea with the 'short-response' class for slightly longer answers. 5. **HTML Implementation**: Each list item starts with the state number and name, followed by the appropriate form element. Ensure spacing with

tags after each element for clarity. 6. **Avoid Images and Placeholders**: Stick to text and form elements without including images or placeholder text. 7. **Indentation and Formatting**: Properly indent tags for readability using two spaces per nesting level. 8. **Validation**: Review the HTML to ensure all tags are correctly opened and closed, and classes are applied appropriately. The final HTML worksheet follows these guidelines, providing a clear and structured way for students to practice matching US states with their capitals.
